Description: Physical and chemical principles governing the fate and transport of contaminants in the aqueous environment, and the applications of such principles in environmental engineering. Emphasis is put on mass transport and transportation processes in natural and engineering systems. Previous course work in fluid mechanics and calculus through differential equations is strongly ...

These are displayed as a confidence interval based on multiple simulations of a chained model application, driven by regional climate model projections, comprising Future Flows Hydrology (Prudhomme et al., 2012b) and QUESTOR (Hutchins et al., 2016a). Summary statistics are based on a comparison of model output from two 30-year periods representing present day and future (2050s) conditions.

Understanding the implications of soil dynamics for hydrology is complicated by the wide range of temporal and spatial scales over which soil processes take effect (Ma et al., 2017b), together with high heterogeneity and difficulty obtaining spatially resolved data (Sidle et al., 2017) at the relevant scales. Accurate measurements at various depths can be obtained by sampling, but this ...

Vaccination is central to controlling COVID-19. Its success relies on having safe and effective vaccines and also on high levels of uptake by the public over time. Addressing questions of population-level acceptability, stability of acceptance, and sub-population variation in acceptability are imperative. Using a prospective design, a repeated measures two-wave online survey was conducted to ...

The Ca²⁺ fluorescent dyes are based on the principles of chelator molecules and consist of two parts: a cavity which traps the free Ca²⁺ and a scaffold retaining the fluorescence properties. Upon binding of free Ca²⁺, conformational changes are induced which greatly alter the absorbance and fluorescence characteristics of the molecule. To monitor rapid oscillations in intracellular Ca²⁺ ...
